# DAT2TXT_GUI QUICK START

OVERVIEW

Dat2txt_gui.exe is a graphical version of the Neuralynx Dat2txt.exe data conversion program. The major change to the program (aside from a new interface) is the ability to process a number of Cheetah (.DAT) data files in a single batch.

INSTRUCTIONS

Double click on the Dat2txt_gui.exe icon to launch the program.

Select the type of files you want to convert with the Input file type box. Then open Windows Explorer (Start, Run, Explorer) and drag the files you want to convert to the Input file window. Select the type of output file you want with the Output file format

box. Optionally choose a directory for output by highlighting a directory with the Output directory select window, and pressing the Change Directory button. Finally, press the Convert button to convert the files in the Input file window. You can press the Clear Window button to clear the input files, if you want to convert several file types. Press the Quit button or Alt-F4 to exit the program.
